1. The trees data frame is built into R, so you don’t have to do anything in particular to access it. Display the first six entries of the trees data set (with no other extraneous text).

2. The column trees$Volume gives the volume (in cubic feet) of timber yielded from 31 felled black cherry trees. What is the sample mean of this sample of timber volumes, rounded to exactly 5 decimal places and including trailing zeros as appropriate? (Your answer to this question should be a complete sentence.)
